

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that could allow the individual driving to maneuver the forklift without leaving the seat. They are constructed out of top quality materials and are meant to be able to endure the most difficult procedures and work environments. Side shifting models have the added ability to laterally position the entire load or the arms so as to facilitate much more precise carrying and position in a faster and much more efficient manner.

The blade pocket is rather unique and enables the operator to safely swing the forks into position without any worry of destroying the positioning cylinders. This could allow the driver the alternative to be able to perform independent or simultaneous fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into fork positioners on available units.
